WorkTrace: component progression across code versions

ILLUSTRATIVE ONLY | Synthetic actions, labels, usage, and checkpoint outcomes

	C1	C2	C3	C4	C5	C6	C7	C8	C9
Classification	exploration	exploration	edit	verification	verification	edit	verification	exploration	verification
Contribution	direct	direct	direct	direct	non-direct	uncertain	uncertain	non-direct	uncertain
Response	R1	R1	R2	R3	R4	R5	R6	R7	R8
Input tokens	1,000	1,000	2,500	3,000	3,100	3,200	3,400	3,500	3,600
Cached input[1]	600	600	1,800	2,400	2,500	2,600	2,800	2,900	3,000
Output tokens	300	300	900	240	60	200	120	100	80
Attribution	½ of R1	½ of R1	Response	Response	Response	Response	Response	Response	Response

Fill = classification | Border = contribution: green direct, orange non-direct, gray uncertain | Diamond = edit

Output: 2,300 total tokens; 800 after the first confirmed passing state, including 200 for an extra edit.

[1] Cached input is included in input here; do not add it again. R1 shares are estimated. Other entries show response-associated usage.

A PASS requires evaluation of that exact version under the same final-test protocol. Later work is not automatically redundant.
